Eastern Biotech reports that the results of the parentage testing procedure carried out on the bodily samples of the donors specified above show that xxxxxx is the biological father of yyyyyy.

**Explanation of testing**

Every person receives half of their DNA from their mother and half from their father. The DNA extracted from the mother's sample is compared with that from the child. Any DNA the child has that the mother does not have must, therefore, have come from the biological father. In a father-child test, the DNA from the father and child are still compared to determine if there is a match or a mismatch, but without the benefit of knowing which DNA the child received from the mother (hence the decreased accuracy of a father-child test).

Eastern Biotech is satisfied that this parentage testing procedure has been properly conducted and analyzed, resulting in the conclusion stated above; and also that all information has been correctly transcribed from the laboratory records.
